This directory contains detailed implementation schemas for all 10 indicators in the Social Influence vulnerability category.

### Overview

Social influence vulnerabilities exploit human tendencies toward conformity, social proof, peer pressure, and trust in social networks.

### Indicators

1. **[3.1] Social Proof Exploitation** - Following others' risky behaviors
2. **[3.2] Peer Pressure Security Bypass** - Conformity to group norms over policy
3. **[3.3] Trust Network Exploitation** - Leveraging social relationships

4. [3.4] **Consensus Bias in Decisions** - Deferring to group consensus
5. [3.5] **Social Validation Seeking** - Need for approval overriding security
6. [3.6] **In-Group Trust Bias** - Reduced scrutiny of in-group members
7. [3.7] **Reciprocity Exploitation** - Quid pro quo social contracts
8. [3.8] **Social Identity Threat** - Identity-based manipulation
9. [3.9] **Celebrity/Influencer Exploitation** - Leveraging social status
10. [3.10] **Network Effect Cascades** - Viral spread of risky behaviors

## Implementation Schema

Each indicator follows the **OFTLISRV** framework with focus on social graph analysis.

## Key Metrics

### Social Proof Compliance Rate

$SPCR = N_{\text{followed\_risky}} / N_{\text{exposed\_to\_risky}}$

Measures tendency to follow others' risky behaviors.

### Trust Network Exploitation Score

$TNES = \Sigma(\text{Trust\_weight} \times \text{Risk\_behavior}) / N_{\text{relationships}}$

### Cascade Propagation Factor

$CPF = N_{\text{influenced}} / N_{\text{initial\_actors}}$

Measures viral spread of behaviors through network.

## Key Data Sources

- **Social Graphs:** Organizational chart, email networks, collaboration tools
- **Communication Platforms:** Slack, Teams, email interaction patterns
- **SIEM:** Correlated events across social connections
- **HR Systems:** Department, team, reporting relationships
- **Badge/Access:** Physical proximity patterns

## Detection Approach

### Social Graph Analysis

```
# Build trust network
G = build_social_graph(email_data, slack_data)

# Identify risky behavior propagation
for user in G.nodes:
    peer_behaviors = [G.neighbors(user).behaviors]
```

```

user_behavior = user.behaviors

if user_behavior == peer_behaviors.mode():
    social_proof_triggered = True

```

## Cascade Detection

```

# Track behavior spread
cascade = detect_cascade(
    initial_event=policy_bypass,
    time_window=24_hours,
    network=social_graph
)

if len(cascade.nodes) > threshold:
    alert_cascade_detected()

```

## Baseline Establishment

Social indicators require: - 90-day social graph construction - Normal communication patterns - Peer influence baselines - Trust network mapping

## Common Event Types

- peer\_action\_observed → 3.1, 3.4
- in\_group\_request → 3.6
- reciprocal\_favor → 3.7
- influencer\_post → 3.9
- cascade\_propagation → 3.10

## Risk Levels

- **Low** (0-0.33): Independent decision-making maintained
- **Medium** (0.34-0.66): Some peer influence, verification still occurs
- **High** (0.67-1.00): Systematic conformity, reduced critical thinking
